

Facts about Trigonometric Substitution	Explanation												
<p>How is Trigonometric Substitution Used?</p>	<p>Trigonometric Substitution (Trig. Sub.) helps simplify a radical or an expression. It is useful if the integrand contains a sum or a difference of squares, often under a radical.</p>

Sub.	Identity	$\sqrt{a^2 - x^2}$	$x = a\sin(\theta)$	$\sin^2(\theta) + \cos^2(\theta) = 1$	$\sqrt{x^2 - a^2}$	$x = a\sec(\theta)$	$\tan^2(\theta) + 1 = \sec^2(\theta)$	$\sqrt{x^2 + a^2}$	$x = a\tan(\theta)$	$\tan^2(\theta) + 1 = \sec^2(\theta)$	<p>A summary of trigonometric substitutions in which the expression considered, trigonometric substitution used, and pythagorean identity applied are in the left column, middle column, and right column respectively.</p>
Expression	Trig. Sub.	Identity											
$\sqrt{a^2 - x^2}$	$x = a\sin(\theta)$	$\sin^2(\theta) + \cos^2(\theta) = 1$											
$\sqrt{x^2 - a^2}$	$x = a\sec(\theta)$	$\tan^2(\theta) + 1 = \sec^2(\theta)$											
$\sqrt{x^2 + a^2}$	$x = a\tan(\theta)$	$\tan^2(\theta) + 1 = \sec^2(\theta)$											
<p style="text-align: center;">Review of the Relationship between Trigonometric Functions and Right Triangles</p> <div style="text-align: center; margin-top: 20px;">  </div>	$\sin(\theta) = \frac{\text{opposite side}}{\text{hypotenuse}}$ $\csc(\theta) = \frac{\text{hypotenuse}}{\text{opposite side}}$ $\cos(\theta) = \frac{\text{adjacent side}}{\text{hypotenuse}}$ $\sec(\theta) = \frac{\text{hypotenuse}}{\text{adjacent side}}$ $\tan(\theta) = \frac{\text{opposite side}}{\text{adjacent side}}$ $\cot(\theta) = \frac{\text{adjacent side}}{\text{opposite side}}$												

1. We will be applying Trigonometric Substitution in order to evaluate $\int \frac{1}{\sqrt{1-x^2}} dx$ through the following parts.
- Determine the appropriate Trigonometric Substitution to use out of the following: $x = a\sin(\theta)$, $x = a\tan(\theta)$, or $x = a\sec(\theta)$. Afterwards, compute dx .
 - Substitute x and dx and simplify as much as possible, using trigonometric identities to get rid of the square root.
 - Evaluate the integral and change your answer back in terms of x . Could you have evaluated your integral in an easier way?
2. We will be applying Trigonometric Substitution in order to evaluate $\int \frac{1}{\sqrt{4+x^2}} dx$ through the following parts.
- Determine the appropriate Trigonometric Substitution to use out of the following: $x = a\sin(\theta)$, $x = a\tan(\theta)$, or $x = a\sec(\theta)$. Afterwards, compute dx .
 - Substitute x and dx and simplify as much as possible, using trigonometric identities to get rid of the square root. Note that $\int \sec(\theta)d\theta = \ln|\sec(\theta) + \tan(\theta)| + C$.
 - Evaluate the integral and change your answer back in terms of x . This may require the use of a right triangle.

3. We will be applying Trigonometric Substitution in order to evaluate $\int \frac{\sqrt{x^2 - 3}}{x} dx$ through the following parts.
- (a) Determine the appropriate Trigonometric Substitution to use out of the following: $x = a\sin(\theta)$, $x = a\tan(\theta)$, or $x = a\sec(\theta)$. Afterwards, compute dx .
- (b) Substitute x and dx and simplify as much as possible, using trigonometric identities to get rid of the square root.
- (c) Evaluate the integral and change your answer back in terms of x . This may require the use of a right triangle.
