

## Math 117: Sequences, Part II

**Example 1.** Show that  $\lim_{n \rightarrow \infty} \left(1 + \frac{(-1)^n}{n}\right) = 1$ .

**Example 2.** Show that  $\lim_{n \rightarrow \infty} \frac{4n^3 - 1}{2n^3 + 3} = \text{_____}$ .

**Example 3.** Show that  $\frac{4n^2 + 7}{2n^4 - 85}$  converges (using the definition of convergence).

*Ideas.* We want to show that  $\lim_{n \rightarrow \infty} \frac{4n^2 + 7}{2n^4 - 85} = \text{_____}$ . If we let \_\_\_\_\_, our goal is to prove that

$$\left| \frac{4n^2 + 7}{2n^4 - 85} \right| < \text{_____}.$$

whenever \_\_\_\_\_. Our idea is to first simplify the fraction by showing that essentially,  $\frac{4n^2 + 7}{2n^4 - 85} \approx \text{const}$  \_\_\_\_\_ for large  $n$ . It would be enough to show that, if

\_\_\_\_\_,

$$\left| \text{_____} \right| \leq k_1 \text{_____}$$

$$\left| \text{_____} \right| \geq k_2 \text{_____}$$

for  $k_1 > 0$  and  $k_2 > 0$ , because then, we would have that  $\frac{|4n^2 + 7|}{|2n^4 - 85|} \leq \text{_____}$ . We expect to be able to do this with, for example  $k_1 = \text{_____}$  and  $k_2 = \text{_____}$ .

Scratch work:

**Proof.** We will show that  $\lim_{n \rightarrow \infty} \frac{4n^2 + 7}{2n^4 - 85} = \underline{\hspace{2cm}}$ . Let  $\underline{\hspace{2cm}}$ . Let

$m = \underline{\hspace{2cm}}$ . If  $n \geq \underline{\hspace{2cm}}$ , then both  $|\underline{\hspace{2cm}}|$  and  $|\underline{\hspace{2cm}}|$  are positive, so

$$|\underline{\hspace{2cm}}| = \underline{\hspace{2cm}} < \underline{\hspace{2cm}} \quad \text{because } \underline{\hspace{2cm}}$$

$$|\underline{\hspace{2cm}}| = \underline{\hspace{2cm}} \geq \underline{\hspace{2cm}} \quad \text{because } \underline{\hspace{2cm}}$$

Therefore,

$$\left| \frac{4n^2 + 7}{2n^4 - 85} \right| = \frac{|4n^2 + 7|}{|2n^4 - 85|} = \frac{4n^2 + 7}{2n^4 - 85} \quad \text{because } \underline{\hspace{2cm}}$$

$$\leq \underline{\hspace{2cm}} = \underline{\hspace{2cm}} \quad \text{because } \underline{\hspace{2cm}}$$

Let  $N = \underline{\hspace{2cm}}$ . Then, if  $n > \underline{\hspace{2cm}}$ ,

$$\left| \frac{4n^2 + 7}{2n^4 - 85} \right| \leq \underline{\hspace{2cm}} < \underline{\hspace{2cm}} \leq \epsilon.$$

Therefore, for every  $\epsilon > 0$ , we have found that there exists  $\underline{\hspace{2cm}}$  such that  $\underline{\hspace{2cm}}$

$\underline{\hspace{2cm}}$ . This is the definition of  $\lim_{n \rightarrow \infty} \frac{4n^2 + 7}{2n^4 - 85} = \underline{\hspace{2cm}}$ .  $\square$

**Theorem.** Let  $(s_n)$  and  $(a_n)$  be sequences of real numbers and let  $s \in \mathbb{R}$ . Assume  $\lim a_n = 0$ . Also, assume there exists  $k > 0$  and  $m \in \mathbb{N}$  such that

$$|s_n - s| \leq k|a_n| \quad \text{for all } n \geq m.$$

It follows that  $\lim s_n = s$ .

**Proof.**  $\underline{\hspace{2cm}}$ . Since  $\lim a_n = 0$ , there exists  $N_1 \in \mathbb{R}$  such that for every  $\underline{\hspace{2cm}}$ ,  $\underline{\hspace{2cm}}$ . Let  $N = \underline{\hspace{2cm}}$ . Then for every  $\underline{\hspace{2cm}}$ , both  $\underline{\hspace{2cm}}$  and  $\underline{\hspace{2cm}}$ . So, by assumption and by the definition of  $N_1$ ,

$$|s_n - s| \leq \underline{\hspace{2cm}} < \underline{\hspace{2cm}} = \underline{\hspace{2cm}}.$$

Therefore,  $\lim s_n = s$ .  $\square$

**Example 4.** Prove that the sequence  $(s_n)$  where  $s_n = \frac{4n^2 + 7}{2n^4 - 85}$  converges using this theorem.

Let  $m = \underline{\hspace{2cm}}$ . We know that for  $n \geq m$ ,

$$\left| \frac{4n^2 + 7}{2n^4 - 85} \right| = \underline{\hspace{10cm}}$$

$$\leq$$

(See the calculations in Example 3.) Therefore,  $|s_n - 0| = |s_n| \leq k|a_n|$  where  $k = \underline{\hspace{2cm}} > 0$  and  $a_n = \underline{\hspace{2cm}}$ . Since  $\underline{\hspace{2cm}} \rightarrow \underline{\hspace{2cm}}$ , the above theorem implies that  $s_n$  converges ( $\lim s_n = \underline{\hspace{2cm}}$ ).

**Example 5.** Prove that  $\lim n^{\frac{1}{n}} = 1$ . (See Example 16.11 in the book.)

**Example 6.** Show that  $((-1)^n)$  diverges.

We show this by contradiction. Assume the sequence  $((-1)^n)$  converges to a limit  $s$ . Then, let  $\epsilon_1 = 1$ .

According the definition of convergence,  $\underline{\hspace{10cm}}$ ,

$$\left| (-1)^n - s \right| < \underline{\hspace{2cm}}.$$

Since there exists  $n_1 > N$  such that  $n_1$  is  $\underline{\hspace{2cm}}$ , we must have that  $|\underline{\hspace{2cm}}| < 1$ . Also, there exists  $n_2 > N$  such that  $n_2$  is  $\underline{\hspace{2cm}}$ , so  $|\underline{\hspace{2cm}}| < 1$ . Therefore, we have both  $\underline{\hspace{2cm}} < s < \underline{\hspace{2cm}}$  and  $\underline{\hspace{2cm}} < s < \underline{\hspace{2cm}}$ . Since this is a contradiction, the sequence  $(s_n)$  is not convergent.

**Theorem.** Every convergent sequence is bounded.

**Proof.** Let  $(s_n)$  be a convergent sequence. Let  $\lim s_n = s$ . From the definition of convergence, we know that there exists  $N \in \mathbb{R}$  such that  $\underline{\hspace{10cm}}$  whenever  $\underline{\hspace{2cm}}$ . But, then if  $\underline{\hspace{2cm}}$ ,

$$\underline{\hspace{4cm}} \leq |s_n - s| < \underline{\hspace{2cm}}.$$

This implies  $\underline{\hspace{2cm}}$ . Let  $M = \underline{\hspace{10cm}}$ . Then, we have that  $|s_n| \leq M$  for all  $n \in \mathbb{N}$ , so  $(s_n)$  is bounded. □
