DQC

Let G = Gal(E/F) and fix a  $\mathbb{C}$ -representation

 $T: G \rightarrow GL(V)$ 

with character  $\chi : g \mapsto tr(\widehat{T}(g))$ .

Then  $V^{I(\mathfrak{P})}$  is  $T|_{G(\mathfrak{P})}$ -invariant where  $I(\mathfrak{P})$  = inertia &  $G(\mathfrak{P})$  = decomposition, so  $\exists$ rep

$$T_{\mathfrak{P}}: \operatorname{\textit{G}}(\mathfrak{P})/\operatorname{\textit{I}}(\mathfrak{P}) 
ightarrow \operatorname{\textit{GL}}(\operatorname{\textit{V}}^{\operatorname{\textit{I}}(\mathfrak{P})})$$

## On the other hand, E/F is Galois, so $\exists$ isomorphism

$$\frac{G(\mathfrak{P})}{I(\mathfrak{P})} \to \mathsf{Gal}\left(\frac{\mathcal{O}_{\mathsf{E}}/\mathfrak{P}}{\mathcal{O}_{\mathsf{F}}/\mathfrak{p}}\right) = \langle \mathsf{Frob}_{\mathsf{N}(\mathfrak{p})} \rangle$$

with

$$\sigma_{\mathfrak{P}} := \left[\frac{E/F}{\mathfrak{P}}\right] \mapsto \mathsf{Frob}_{\mathcal{N}(\mathfrak{p})}$$

where 
$$\left[\frac{E/F}{\mathfrak{P}}\right]$$
 is the Artin symbol of  $E/F$  at  $\mathfrak{P}$ .

イロト イポト イヨト イヨト

= 900

Framework Definition of  $L(s, \chi)$ Properties

#### Fact

If S is an equivalent representation of T and  $\mathfrak{Q} \neq 0$  is another prime in  $\mathcal{O}_E$  lying over  $\mathfrak{p}$ , then for all  $s \in \mathbb{C}$ 

$$\det\left(I - \widehat{T}_{\mathfrak{P}}\left(\sigma_{\mathfrak{P}}\right) \mathsf{N}(\mathfrak{p})^{-s}\right) = \det\left(I - \widehat{S}_{\mathfrak{Q}}\left(\sigma_{\mathfrak{Q}}\right) \mathsf{N}(\mathfrak{p})^{-s}\right)$$

イロト イポト イヨト イヨト

-

DQC

Introduction Relevance of *L*-functions Induced Class Functions and Brauer's Theorems Framework Definition of  $L(s, \chi)$ Properties

Suppose

$$\mathfrak{p}\mathcal{O}_E=\mathfrak{P}_1^e\cdots\mathfrak{P}_g^e$$

is a prime decomposition in  $\mathcal{O}_{\mathcal{K}}$ .

If p is unramified in E/F (i.e., e = 1, true for all but finitely many p), then  $I(\mathfrak{P})$  is trivial (and conversely), so we may view

 $\sigma_{\mathfrak{P}} \in \mathcal{G}(\mathfrak{P}) \subseteq \mathcal{G}$ 

and

$$T_{\mathfrak{P}}=T|_{G(\mathfrak{P})}.$$

イロト 不得 トイヨト イヨト

∃ <2 <</p>

# Definition We now define the Artin *L*-function of $\chi$ as $L(s, \chi, E/F) = \prod_{0 \neq \mathfrak{p} \in \text{Spec}(\mathcal{O}_F)} \det(I - \widehat{T}_{\mathfrak{P}}(\sigma_{\mathfrak{P}})N(\mathfrak{p})^{-s})^{-1}.$ We write $L(s, \chi)$ for $L(s, \chi, E/F)$ if the extension is understood.

<u>Note</u>: When dim( $V^{l(\mathfrak{P})}$ ) = 0, the factor corresponding to  $\mathfrak{p}$  is 1.

Introduction Relevance of *L*-functions I Induced Class Functions and Brauer's Theorems I

Framework Definition of  $L(s, \chi)$ Properties

## Example

Let  $E = \mathbb{Q}(e^{2\pi i/3}, \sqrt[3]{2})$  and  $F = \mathbb{Q}$ . Then we may identify  $G = S_3$ . Consider  $\widehat{T} : G \to GL(\mathbb{C}^{3\times 3})$  given by

$$( 1 \ \ 2 ) \mapsto \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

and

$$(1 \ 2 \ 3) \mapsto \begin{pmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}$$

Jordan Schettler Brauer's Theorems and the Meromorphicity of *L*-Functions

#### Example (continued)

For 
$$\mathfrak{p} = 3\mathbb{Z}$$
, we have  $I(\mathfrak{P}) = G(\mathfrak{P}) = G$ , so  $V^{I(\mathfrak{P})} = \mathbb{C} \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$ , giving

$$\widehat{T}_{\mathfrak{P}}(\sigma_{\mathfrak{P}}) = \mathbf{1}$$

Therefore the local factor at p is

$$\frac{1}{1-3^{-s}}$$

Jordan Schettler Brauer's Theorems and the Meromorphicity of *L*-Functions

イロト イポト イヨト イヨト

= 900

Introduction Relevance of *L*-functions Induced Class Functions and Brauer's Theorems Framework Definition of  $L(s, \chi)$ Properties

## Example (continued)

For  $\mathfrak{p} = 5\mathbb{Z}$ , we have  $I(\mathfrak{P}) = \{1\}$  and  $G(\mathfrak{P}) = \langle (1 \ 2) \rangle$ , so  $V^{I(\mathfrak{P})} = V$  and  $\sigma_{\mathfrak{P}} = (1 \ 2)I(\mathfrak{P})$ , giving

$$\widehat{\mathcal{T}}_{\mathfrak{P}}(\sigma_{\mathfrak{P}}) = \widehat{\mathcal{T}}((egin{array}{ccc} 1 & 2)) = egin{pmatrix} 0 & 1 & 0 \ 1 & 0 & 0 \ 0 & 0 & 1 \end{pmatrix}$$

Therefore the local factor at p is

$$\begin{vmatrix} 1 & -5^{-s} & 0 \\ -5^{-s} & 1 & 0 \\ 0 & 0 & 1-5^{-s} \end{vmatrix}^{-1} = \frac{1}{(1-5^{-s})(1-5^{-2s})}$$

イロト 不得 トイヨト イヨト

E DQC

Framework Definition of  $L(s, \chi)$ Properties

## Example (continued)

Similarly, it can be shown that the local factor at  $3\mathbb{Z}$  is

$$\frac{1}{1-3^{-s}},$$

and the local factor at  $7\mathbb{Z}$  is

$$\frac{1}{1-7^{-3s}}$$

- $L(s, \chi)$  is analytic in s on the half plane where  $\Re(s) > 1$
- If  $\chi = \chi_1 + \chi_2$  for some characters  $\chi_1, \chi_2$ , then

$$L(\boldsymbol{s},\chi) = L(\boldsymbol{s},\chi_1)L(\boldsymbol{s},\chi_2)$$

• In particular, if  $\chi_1, \ldots, \chi_r$  are the irreducible characters, then

$$L(\boldsymbol{s},\chi) = \prod_{j=1}^{r} L(\boldsymbol{s},\chi_j)^{(\chi,\chi_j)},$$

where

$$(\chi,\psi) = \frac{1}{|G|} \sum_{g \in G} \chi(g) \psi(g^{-1})$$

- $L(s, \chi)$  is analytic in s on the half plane where  $\Re(s) > 1$
- If  $\chi = \chi_1 + \chi_2$  for some characters  $\chi_1, \chi_2$ , then

$$L(\boldsymbol{s},\chi) = L(\boldsymbol{s},\chi_1)L(\boldsymbol{s},\chi_2)$$

 In particular, if χ<sub>1</sub>,..., χ<sub>r</sub> are the irreducible characters, then

$$L(\boldsymbol{s},\chi) = \prod_{j=1}^{r} L(\boldsymbol{s},\chi_j)^{(\chi,\chi_j)},$$

where

$$(\chi,\psi)=rac{1}{|G|}\sum_{g\in G}\chi(g)\psi(g^{-1})$$

If deg( $\chi$ ) =  $\chi$ (1) = 1 (always true when both *G* is abelian and  $\chi \in Irr(G)$  = set of irreducible characters in *G*), then

**Special Cases** 

**Applications** 

$$L(\boldsymbol{s}, \chi) = \prod_{0 \neq \mathfrak{p} \in \operatorname{Spec}(\mathcal{O}_F)} \frac{1}{1 - \chi(\mathfrak{p}) N(\mathfrak{p})^{-s}} = \sum_{\operatorname{ideals} J \neq 0} \frac{\chi(J)}{N(J)^s}$$

where

$$\chi(J) = \prod_{\mathfrak{p}^{\boldsymbol{arphi}}||J} \widehat{\mathcal{T}}_{\mathfrak{P}}(\sigma_{\mathfrak{P}})^{\boldsymbol{arphi}} \in \mathbb{C}$$

## Example

Let 
$$E = \mathbb{Q}(\sqrt{2})$$
,  $F = \mathbb{Q}$ . Then  $G = \{1, g\}$  where  $g(\sqrt{2}) = -\sqrt{2}$ .

**Special Cases** 

**Applications** 

Consider 
$$\chi = \widehat{T} : G \to \mathbb{C}^{\times} = GL(\mathbb{C})$$
 given by  $g \mapsto -1$ .

For  $\mathfrak{p} = 2\mathbb{Z}$ , we have  $\mathfrak{p}\mathcal{O}_E = (\sqrt{2}\mathcal{O}_E)^2$ , so  $I(\mathfrak{P}) = G(\mathfrak{P}) = G$ , giving  $V^{I(\mathfrak{P})} = \{0\}$ . Thus the local factor at  $\mathfrak{p}$  is 1.

#### Example (continued)

Now suppose  $p \in \mathbb{N}$  is an odd prime. Then  $I(\mathfrak{P}) = \{1\}$ . If (2|p) = 1, then  $G(\mathfrak{P}) = \{1\}$ , and if (2|p) = -1, then  $G(\mathfrak{P}) = G$ .

Thus the local factor at  $\mathfrak{p} = p\mathbb{Z}$  is

$$\frac{1}{1-(2|p)p^{-s}}$$

## Example (continued)

Therefore

## For the trivial character $1_G \in Irr(G)$ , we have

$$L(s, 1_G) = \sum_{\text{ideals } J \neq 0} \frac{1}{N(J)^s} = \zeta_F(s),$$

which is the Dedekind zeta function of the number field F.

イロト 不同 トイヨト イヨト

= 990

Also, if  $F = \mathbb{Q}$  and  $E = \mathbb{Q}(e^{2\pi i/m})$  while  $\chi \in Irr(G)$  is arbitrary, then  $G \cong (\mathbb{Z}/m\mathbb{Z})^{\times}$  is abelian and

**Special Cases** 

**Applications** 

$$L(\boldsymbol{s},\chi) = \sum_{n=1}^{\infty} \frac{\chi(n\mathbb{Z})}{|\mathbb{Z}/n\mathbb{Z}|^{\boldsymbol{s}}},$$

which is a Dirichlet *L*-function.

イロト 不得 トイヨト イヨト

E DQC

In particular, if m = 1 then  $E = F = \mathbb{Q}$ , so  $Irr(G) = \{1_G\}$  and

$$L(\boldsymbol{s}, \boldsymbol{1}_{\boldsymbol{G}}) = \sum_{n=1}^{\infty} \frac{1}{|\mathbb{Z}/n\mathbb{Z}|^{\boldsymbol{s}}} = \zeta(\boldsymbol{s}),$$

which is the Riemann zeta function.

In the abelian case, L-functions have been used in the proofs of

- prime number theorem (Riemann zeta function)
- prime ideal theorem (Dedekind zeta functions)
- primes in arith. prog. theorem (Dirichlet *L*-functions)

イロト イポト イヨト イヨト

Sac

In the nonabelian case, *L*-functions can be used to prove the following theorem

Theorem (Chebotarev, 1922)

Let E, F, G be as above and C be a conjugacy class in G. Then the set of unramified primes  $\mathfrak{p} \neq \mathfrak{0}$  in  $\mathcal{O}_F$  such that  $\sigma_{\mathfrak{P}} \in C$  for some prime  $\mathfrak{P}$  in  $\mathcal{O}_E$  with  $\mathfrak{P} \cap \mathcal{O}_F = \mathfrak{p}$  has density |C|/|G|.

### Definition

An elementary (resp. hyper-elementary) subgroup of *G* is a subgroup of the form  $C \times P$  (resp.  $C \rtimes P$ ) where *P* is a *p*-group for some prime *p* and *C* is cyclic with (|C|, p) = 1.

ヘロア 人間 アメヨア 人口 ア

Sar

<u>Notation</u>: (1) Let  $\mathcal{E}$  (resp.  $\mathcal{H}$ ) be the set of elementary (resp. hyper-elementary) subgroups of *G*.

(2) Let  $\mathcal{R}$  be the ring of all class functions of G which restrict to generalized characters on H for all  $H \in \mathcal{E}$ .

(3) Let  $\mathcal{I}$  be the  $\mathbb{Z}$ -module generated by all characters of the form  $\lambda^{G}$  where  $\lambda$  is a linear character of some  $H \in \mathcal{E}$ .

・ロト ・ 国 ト ・ 国 ト ・ 国 ト

= nar

Theorem (Brauer's Induction and Characterization Theorem) We have  $\mathcal{I} = Char(G) = \mathcal{R}$ .

- The first equality says, in particular, that every irreducible character can be written as the Z-linear combination of characters induced from linear characters of elementary subgroups.
- The second equality says that a class function of *G* is a generalized character of *G* if and only if it restricts to generalized characters for all elementary subgroups.

ヘロア 人間 アメヨア 人口 ア

Sac

Sketch of Proof of Brauer's Theorems. STEP 1:  $\mathcal{I} \subseteq$  Char(G)  $\subseteq \mathcal{R}$  and  $\mathcal{I}$  is an ideal in  $\mathcal{R}$ 

STEP 2:  $1_G = \sum_{H \in \mathcal{H}} a_H (1_H)^G$  with  $a_H \in \mathbb{Z}$  by Banaschewski

STEP 3: Assume  $G = C \rtimes P \in \mathcal{H}$  by transitivty of induction

STEP 4: If  $G \in \mathcal{E}$ , we're done; otherwise  $G \neq N := N_G(P) \in \mathcal{E}$ 

Induction Brauer's Theorems

## Sketch Continued.

STEP 5:  $(1_N^G, 1_G)_G = (1_N, 1_N)_N = 1$  by Frobenius

STEP 6: 
$$\mathbf{1}_{G} = \mathbf{1}_{N}^{G} - \sum_{\mathbf{1}_{G} \neq \chi_{i}} \mathbf{a}_{i} \chi_{i}$$
 with  $\mathbf{a}_{i} \in \mathbb{Z}$ 

STEP 7: Suppose  $\chi_i(1) = 1$  for some *i* 

STEP 8:  $P \in \text{Syl}_{p}(K)$  and  $N \leq K$  with  $K := \text{ker}(\chi_{i}) \leq G$ 

STEP 9:  $G = KN \subseteq K \neq G$  by Frattini

## Theorem (Meromorphicity of *L*-Functions)

In the context of G = Gal(E/F), there are intermediate fields  $K_1, \ldots, K_m$  of E/F and integers  $n_i$  such that

$$L(\boldsymbol{s}, \boldsymbol{\chi}, \boldsymbol{E}/\boldsymbol{F}) = \prod_{j=1}^{m} L(\boldsymbol{s}, \xi_j, \boldsymbol{E}/\boldsymbol{K}_j)^{n_j}$$

for some linear characters  $\xi_j$  of Gal( $E/K_j$ ); in particular, Artin *L*-functions are meromorphic.

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

Sar

#### Example

Let  $E = \mathbb{Q}(e^{2\pi i/3}, \sqrt[3]{2})$ ,  $F = \mathbb{Q}$ ,  $\widehat{T}$  be as in the first example. Set  $H = \langle (2 \ 3) \rangle = \operatorname{Stab}_G(1)$  and take *K* to be the fixed field of *H*. Then inducing the trivial character on *H* gives us the permutation character  $\chi$  of  $\widehat{T}$ . Thus

$$L(\boldsymbol{s}, \boldsymbol{\chi}, \boldsymbol{E}/\boldsymbol{F}) = L(\boldsymbol{s}, \boldsymbol{1}_{H}, \boldsymbol{E}/\boldsymbol{K}) = \zeta_{\boldsymbol{K}}(\boldsymbol{s})$$

is actually well-understood.

・ロト ・ 国 ト ・ 国 ト ・ 国 ト

Sac

## Proof of Meromorphicity.

We may assume  $\chi \in Irr(G)$ . Then by Brauer's induction theorem there are elementary subgroups  $H_1, \ldots, H_m$  and linear characters  $\lambda_i$  of  $H_i$  with

$$\chi = \sum_{j=1}^{m} n_j \lambda_j^G$$

for some  $n_1, \ldots, n_m \in \mathbb{Z}$ . The result now follows from Galois correspondence and the properties of *L*-functions above.

ヘロア 人間 アメヨア 人口 ア

Sar

## Conjecture (Artin)

If  $\chi \in Irr(G)$ , then  $L(s, \chi)$  is an entire function unless  $\chi$  is the trivial character, in which case the only pole of  $L(s, \chi)$  is a simple pole at s = 1.

Note: Artin's conjecture is known to be true in the cases where [G, G] is abelian, *G* is a *p*-group, or |G| is squarefree.

## Example

Let *E* be the splitting field of  $x^4 + 3x + 3$  over  $F = \mathbb{Q}$ .

• 
$$G = \operatorname{Gal}(E/F) \cong D_8 = \langle a, b | a^4 = b^2 = 1, ab = ba^{-1} \rangle$$

•  $H_1 := Z(G), H_2 := \langle a \rangle, K_j$  is the fixed field of  $H_j$  for j = 1, 2

## Example

Let *E* be the splitting field of  $x^4 + 3x + 3$  over  $F = \mathbb{Q}$ .

• 
$$G = \operatorname{Gal}(E/F) \cong D_8 = \langle a, b | a^4 = b^2 = 1, ab = ba^{-1} \rangle$$

•  $H_1 := Z(G), H_2 := \langle a \rangle, K_j$  is the fixed field of  $H_j$  for j = 1, 2

## Example (continued)

 G/H<sub>1</sub> ≅ C<sub>2</sub> × C<sub>2</sub> has 4 irreducible characters ψ<sub>1</sub>,...,ψ<sub>4</sub>, which inflate to 4 irreducible characters χ<sub>j</sub> = inf<sub>G</sub><sup>G/H<sub>1</sub></sup>(ψ<sub>j</sub>) of G; turns out that

$$L(\boldsymbol{s}, \chi_j, \boldsymbol{E}/\boldsymbol{F}) = L(\boldsymbol{s}, \psi_j, \boldsymbol{K}_1/\boldsymbol{F})$$

The remaining character χ<sub>5</sub> is induced from a character φ<sub>3</sub> of H<sub>2</sub>, so
 L(s, χ<sub>5</sub>, E/F) = L(s, φ<sub>3</sub>, E/K<sub>2</sub>)
