& generaliter nullam in infinitum ultra quadratum potestatem in duos eiusdem
nominis fas est diuidere cuius rei demonstrationem mirabilem sane detexi.
Hanc marginis exiguitas non caperet.*

Fermat proved this conjecture in the case $n = 4$ by the method of infinite descent.

Pierre de Fermat (1601–1665)

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

Fermat claimed that if $n \geq 3$, there are no tuples of positive integers (x, y, z) s.t. $x^n + y^n = z^n$

OBSERVATIO DOMINI PETRI DE FERMAT.

*Cubum autem in duos cubos, aut quadratoquadratum in duos quadratoquadratos
& generaliter nullam in infinitum ultra quadratum potestatem in duos eiusdem
nominis fas est diuidere cuius rei demonstrationem mirabilem sane detexi.
Hanc marginis exiguitas non caperet.*

Fermat proved this conjecture in the case $n = 4$ by the method of infinite descent.

Thus the conjecture boils down to the case $n = p$.

Ernst Kummer (1810–1893)

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

Suppose (x, y, z) is a tuple of pairwise relatively prime integers s.t. $x^p + y^p = z^p$.

Ernst Kummer (1810–1893)

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

Suppose (x, y, z) is a tuple of pairwise relatively prime integers s.t. $x^p + y^p = z^p$.

As ideals in $\mathbb{Z}[\zeta_p]$:

$$\begin{aligned}(z)^p &= (x^p + y^p) \\ &= \prod_{j=0}^{p-1} (x + \zeta_p^j y)\end{aligned}$$

Ernst Kummer (1810–1893)

We say a prime p is regular if $p \nmid$ class number of $\mathbb{Q}(\zeta_p)$.

Conjectured Distribution of Primes

There are ∞ many irregular primes: 37, 59, 67, 101, ...

but it's unknown if there are ∞ many regular primes

Theorem (Kummer's Criterion)

An odd prime p is regular if and only if $p \nmid$ numerator of B_j for all $j = 2, 4, \dots, p-3$ where $\frac{x}{e^x-1} = \sum_{n=0}^{\infty} B_n \frac{x^n}{n!}$.

Bernoulli Numbers: $\frac{x}{e^x-1} = \sum_{n=0}^{\infty} B_n \frac{x^n}{n!}$

$B_0 = 1, B_1 = -\frac{1}{2}$ while $B_{2n+1} = 0$ for all n and

$$B_2 = \frac{1}{6}, \quad B_4 = -\frac{1}{30}, \quad B_6 = \frac{1}{42},$$

$$B_8 = -\frac{1}{30}, \quad B_{10} = \frac{5}{66}, \quad B_{12} = -\frac{691}{2730}$$

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa

The Main
Conjecture

More About Bernoulli Numbers

In lowest terms,

$$B_{2n} \text{ has denominator} = \prod_{p-1|2n} p$$

$$B_{2n} \text{ has numerator} = ???$$

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

More About Bernoulli Numbers

In lowest terms,

$$B_{2n} \text{ has denominator} = \prod_{p-1|2n} p$$

$$B_{2n} \text{ has numerator} = ???$$

Theorem (Kummer Congruences)

If $n \equiv m \not\equiv -1 \pmod{p-1}$,

$$\frac{B_{n+1}}{n+1} \equiv \frac{B_{m+1}}{m+1} \pmod{p}$$

Zeta Values

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

In 1735, Euler showed

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots = \frac{\pi^2}{6}$$

In general,

$$\frac{1}{1^{2n}} + \frac{1}{2^{2n}} + \cdots = \frac{|B_{2n}|(2\pi)^{2n}}{2(2n)!}$$

Zeta Values

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

In 1735, Euler showed

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots = \frac{\pi^2}{6}$$

In general,

$$\frac{1}{1^{2n}} + \frac{1}{2^{2n}} + \cdots = \frac{|B_{2n}|(2\pi)^{2n}}{2(2n)!}$$

In 1913, Ramanujan suggested

$$1 + 2 + 3 + \cdots = -\frac{1}{12}$$

In general,

$$1^n + 2^n + 3^n + \cdots = -\frac{B_{n+1}}{n+1}$$

Bernhard Riemann (1826–1866)

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

For $\Re(s) > 1$,

$$\zeta(s) := \sum_{n=1}^{\infty} \frac{1}{n^s} = \prod_p (1 - p^{-s})^{-1}$$

Bernhard Riemann (1826–1866)

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa
Modules

The Main
Conjecture

For $\Re(s) > 1$,

$$\zeta(s) := \sum_{n=1}^{\infty} \frac{1}{n^s} = \prod_p (1 - p^{-s})^{-1}$$

$\exists!$ meromorphic continuation of ζ s.t.

$$\frac{\zeta(s)}{(-s)!} = (2\pi)^{s-1} 2 \sin(s\pi/2) \zeta(1-s)$$

Restatement of Kummer Criterion

Cyclotomic
Fields

\mathbb{Z}_p -Extensions

Iwasawa

The Main
Conjecture

Iwasawa spoke about the next result in his talk *A theorem on Abelian groups and its application to algebraic number theory* at the 1956 summer meeting of the AMS.

Theorem (Iwasawa's Growth Formula)

Suppose $F \subset F_1 \subset F_2 \dots$ is a \mathbb{Z}_p -extension of number fields. Let A_n denote the p -primary part of the class group of F_n . Then \exists integers λ, μ, ν s.t.

$$|A_n| = p^{\lambda n + \mu p^n + \nu}$$

for all sufficiently large n .

Theorem

Suppose F is a number field in which p splits completely. Then $\lambda \geq r_2$ for the cyclotomic \mathbb{Z}_p -extension $F\mathbb{Q}_\infty/F$ where $r_2 = \#$ complex primes of F .

E.g., consider $F = \mathbb{Q}(\sqrt{-1})$. If $p \equiv 1 \pmod{4}$, then p splits in F/\mathbb{Q} , so here $\lambda \geq 1$ for $\mathbb{Q}_\infty(i)/\mathbb{Q}(i)$.

What about $r_2 = 0$ (F is totally real)? Can we have $\lambda > 0$?

Theorem

Suppose M is a finitely gen'd Λ -module. Then \exists homomorphism with finite kernel and cokernel

$$M \longrightarrow \Lambda^r \oplus \bigoplus_{i=1}^s \frac{\Lambda}{(p^{m_i})} \oplus \bigoplus_{j=1}^t \frac{\Lambda}{(f_j(T)^{n_j})}$$

where each $f_j(T) \equiv x^{\deg(f_j)} \pmod{p}$ is an irred. poly.

Characteristic Polynomial

In particular, \exists homom. with finite kernel and cokernel

$$X \longrightarrow \bigoplus_{i=1}^s \frac{\Lambda}{(p^{m_i})} \oplus \bigoplus_{j=1}^t \frac{\Lambda}{(f_j(T)^{n_j})}$$

where each $f_j(T) \equiv x^{\deg(f_j)} \pmod{p}$ is an irred. poly.
